

Q2: certified reception lens and second-station choices

First station $s = (0, 0)$ m | Reported bearing = 0 degrees | Angular tolerance = 1.0051 degrees

A Intersection of four radius-1000 m disks

B Canonical choices from the frozen result

The four-disk intersection certifies reception under the shared hidden-radius model; it does not certify localization.

Without target-domain clipping this lens is exact. Domain clipping can enlarge the safe set. Points: q2_precision_v2/bound_convergence.json
